* The maximum values described in the table were the highest values of the monitoring results at the heights of 50cm and 1m above the ground (for parking areas, the maximum values were the highest average values). Likewise, the minimum values were the lowest values at those heights.

* The number of monitored facilities excludes the 13 tourist spots at which measurements could not be conducted due to the effects of earthquake damages, etc., among the 276 scheduled monitoring tourist spots in the action plan, but includes another 1 tourist spot at which additional surveys were conducted.

* “No. of non-comparable facilities” indicates 389 locations at the height of 1m and 399 locations at the height of 50cm at which the air dose rate could not be compared with the previous monitoring results (conducted in July and August 2011), such as newly monitored locations in this monitoring.

4 Changes in Air Dose Rates

Air dose rates in each monitored location decreased by 72.6% and 71.1% at the monitored height of 1m and 50cm respectively, compared with the previous survey results.

Largest reduction rate (Kenpoku) 80.0% ($1.9\mu\text{Sv/h} \rightarrow 0.38\mu\text{Sv/h}$)

5 Future Responses

In the future, additional surveys will be conducted if necessary in consideration of the status of dose reduction measures, etc. in each area.
